Fuggin Fabrication & Engineering – Exhaust Systems

A set of pipes can totally make or break the look of a bike. Fuggin Fabrication covers areas other exhaust manufactures fear to tread. Our exhausts are sleek with aggressive and classic lines that set them apart from others. But they also deliver more than world-class style. The triple-step design insures exceptional performance as well as head-turning sound. And, unlike most custom pipes, ours are crafted entirely by hand right in our shop before being sent to finishing.

Designing exhaust systems is no sample task. There are a number of areas to consider and style doesn't always come first. We look at how to make the engine breath better and improve the performance of the bike. Pipe diameter, length, baffle size and location all play a part in the design of an exhaust. Our designs are developed to create just the right amount of back pressure for low end torque and also give you performance at cruising speeds.

Looking toward the future for exhaust systems - We are currently working on CAT exhaust designs for custom motorcycle manufactures to help them meet the new EPA/CARB and Eur-3 emissions requirements for 2009/2010. We have had to take a new direction for building motorcycle exhaust. The CAT exhaust will have a catalytic converter built into them for emissions requirements and a baffle system that keeps the sound levels to a minimum. This is a far cry from the custom exhaust systems we currently manufacture. We have always designed exhaust for maximum performance, style and sound quality. We are working to help the custom builders to meet there future requirement.

In working with custom production motorcycle and motor manufactures we are hoping to have this exhaust ready for production within the next 3 to 6 months.

Thanks,
Doug & Kelly
